Notes

Algebra Section 4.2

Pages 215-221

**Goal:** "You will use a table to graph a linear equation"  
"You will graph horizontal and vertical lines"  
"Choose appropriate  $x$  values"

### Vocabulary

Linear Equation: Any \_\_\_\_\_ whose graph is a \_\_\_\_\_ line. Linear equations can be written in the form \_\_\_\_\_, which is called "\_\_\_\_\_".

In this form, both  $A$  and  $B$  \_\_\_\_\_ be \_\_\_\_\_.

Solution: \*\*Any \_\_\_\_\_  $(x,y)$  that makes the \_\_\_\_\_ true when substituted.

\*\* Any \_\_\_\_\_ on the line

\*\* Note: Since a \_\_\_\_\_ continues on \_\_\_\_\_ in \_\_\_\_\_, and there are \_\_\_\_\_ points on a line, then a \_\_\_\_\_ has \_\_\_\_\_.

**Example:** Which ordered pair is a solution to :  $3x - y = 7$ ;  $(3,4)$  or  $(1, -4)$ ? Explain.

$(3,4)$

$x=$   
 $y=$

Plug  $x$  and  $y$  into the equation.

$$3x - y = 7$$

$(1, -4)$

$x=$   
 $y=$

Plug  $x$  and  $y$  into the equation.

$$3x - y = 7$$

Which one is a solution to the equation? \_\_\_\_\_

Try These:

1) Which ordered pair is a solution to:  $2x - 6 = 3y$ ;  $(3,-2)$  or  $(0,-2)$ ?

2) Tell whether  $(4, -\frac{1}{2})$  is a solution to  $x + 2y = 5$ . Why or why not?

3) Are the following points solutions to the linear equation represented by the line graphed?

- a)  $(1, 6)$
- b)  $(-3, 2)$

4) List three ordered pairs that are solutions to the equation  $3x - 5 = y$

5) If  $x$  is 5, what ordered pair is a solution to the equation  $2x + 4y = 8$ ?

## Graphing a linear equation by making a table:

Make sure the equation is in \_\_\_\_\_ form!

1) Rewrite the equation so it is in function form which means to isolate \_\_\_\_\_

Example:  $-2x + y = -3$

2) Choose 5 appropriate values for  $x$ . Typically these values are:

\*\*Do not choose these values if:

- There is a restriction on the \_\_\_\_\_. For example, if it says  $x \geq 0$ , then you must choose only \_\_\_\_\_ values, or if dealing with \_\_\_\_\_. Time cannot be \_\_\_\_\_.

-If after putting the equation in function form, the \_\_\_\_\_ of  $x$  is a \_\_\_\_\_, then it makes most sense to choose \_\_\_\_\_ of the \_\_\_\_\_ to avoid \_\_\_\_\_.

3) Plug your 5 values into the function for  $x$ , find out what  $y$  is for each to complete your table.

x	-2	-1	0	1	2
y					

4) Graph the ordered pairs you now have from your table.

Try These:

1) Graph  $y = 2 - 2x$

x					
y					

2) Graph  $y + 3x = 2$

x					
y					

3) Graph  $y = -3x + 1$  with a domain of  $x \geq 0$  \*which values can you **not** choose for  $x$ ? Why?

$x$					
$y$					

**\*Identify the range...**

4) Graph  $y = -\frac{1}{2}x + 4$  \*\*which values should you pick for  $x$ ? Why?

$x$					
$y$					

5) Graph  $y = \frac{2}{3}x - 1$  with a domain of  $x \leq 0$  then identify the range.

$x$					
$y$					

**Range:** \_\_\_\_\_

6) Graph  $y = -3$

$x$					
$y$					

7) Graph  $x = 4$

$x$					
$y$					

8) The distance,  $d$ , in miles, that a runner travels is given by the function  $d = 6t$  where  $t$  is the time (in hours) spent running. The runner plans to go for a 1.5 hour run. Set up a table and identify the domain and range of the function. Choose at least 4 values for  $t$ .

9) Suppose the same runner decides he wants to run 12 miles. Set up a new table with at least 3 values and identify the new domain and range.

10) For gas that costs \$2 per gallon, the equation  $C = 2g$  gives the cost,  $C$ , in dollars for  $g$  gallons of gas. You plan to pump \$10 worth of gas. Set up a table and identify the domain and range.
